Enterprise Architecture

Persistence

Scaling Database Use case: Cassandra What are the trade offs of persistence/DB?

Speed vs durability

- Pure in-memory, no persistence at all, such as memcached or Scalaris
- In-memory with periodic snapshots, such as Oracle Coherence or Redis
- Disk-based with update-in-place writes, such as MySQL ISAM or MongoDB
- Commitlog-based, such as all traditional OLTP databases (Oracle, SQL Server, etc.)

Data Model?

key-value

Amazon DynamoDB (Beta)

Focus Of Different Data Models

Trade offs

- Read
 - https://www.datastax.com/blog/2010/10/ what-persistence-and-why-does-it-matter

- Claim
 - A massively scalable open source NoSQL database.
 - Distributed across multiple data centers with no single point of failure.
 - Low latency queries

- Claim
 - A massively scalable open source NoSQL database.
 - Distributed across multiple data centers with no single point of failure.
 - Low latency queries

How would you build such system?

- We can't offer ACID RDBMS constraints
 - Two phase commit is anti-availability
- We need to compromise :(

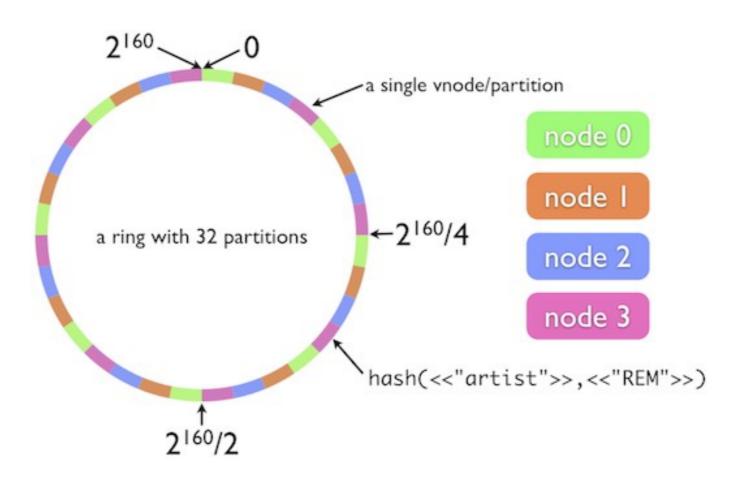

Sharding

- A developer can select an attribute and shard the table between different nodes
 - e.g. shard users table by country code

Do you see the problem?

- Shared Nothing Architecture, scales well!
- Check Pros and Cons:
 - https://en.wikipedia.org/wiki/
 Shard (database architecture)

Consistent Hashing

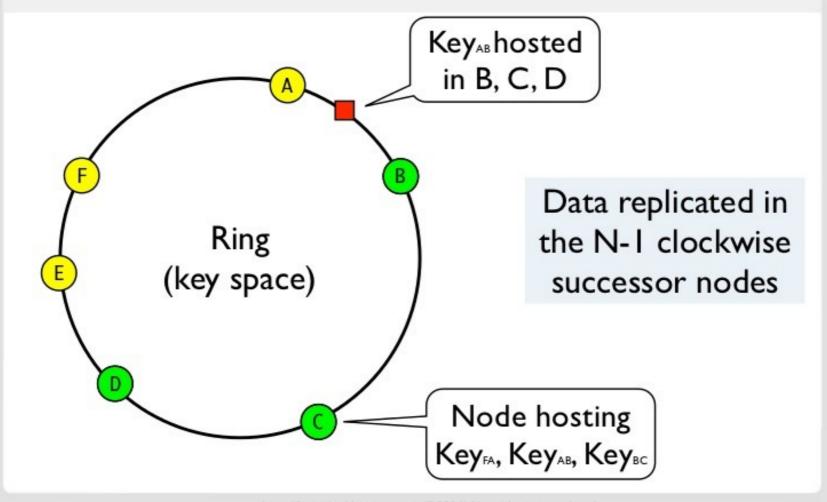

https://dzone.com/articles/simple-magic-consistent

Replication

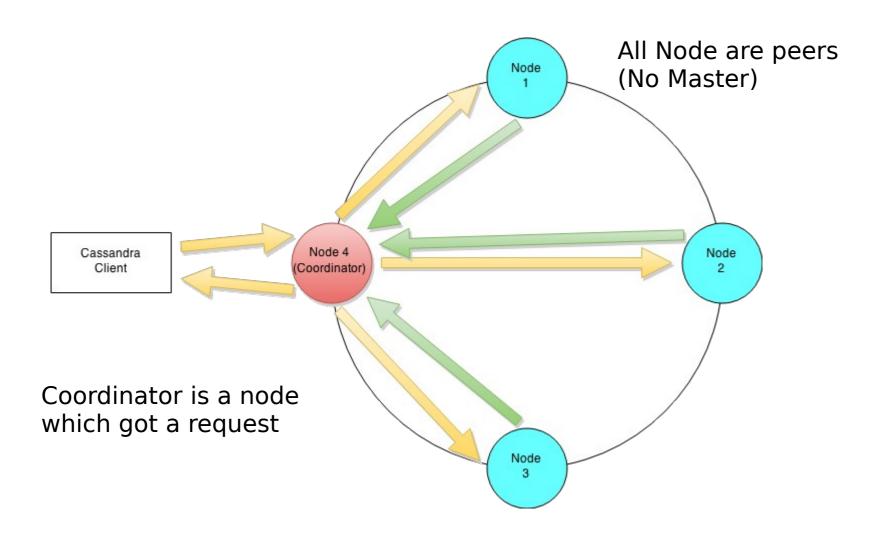

- Storing copies of data on multiple nodes
- Replication of data ensures fault tolerance and reliability.

Consistent Hashing - Replication

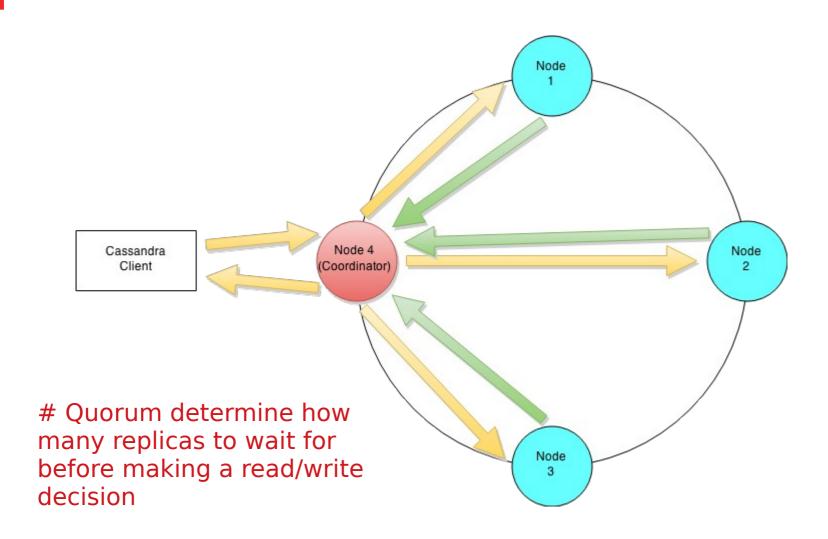

- Eventual Consistency
 - Typically it's AP system (remember CAP?)
- Tunable Consistency by setting quorum level
 - From "writes never fail" → A
 - to "block for all replicas to be readable" → C

Coordination

https://dzone.com/articles/introduction-apache-cas sandras

Coordination

How to choose

- Watch:
 - How to Choose the Right Database? MongoDB, Cassandra, MySQL, HBase |
 Frank Kane
 - https://www.youtube.com/watch?
 v=v5e PasMdXc

Final thoughts

- Know your data!
- Replication, sharding and consistent hashing are important concepts
 - Nothing is free :(
- We omitted several Cassandra speceifcs
 - SStable, tombstone ,...
